ICLR 2025 FM-Wild Workshop Reviewer Invitation

Vivek Mishra <vivekmishraima@gmail.com>

[ICLR 2025 FM-Wild Workshop] Invitation to serve as Reviewer

1 message

OpenReview <noreply@openreview.net>
To: vivekmishraima@gmail.com

Wed, Feb 12, 2025 at 1:46 PM

Dear invitee,

You have been nominated by the program chair committee of ICLR 2025 FM-Wild Workshop to serve as Reviewer. As a respected researcher in the area, we hope you will accept and help us make ICLR 2025 FM-Wild Workshop a success. We aim to assign a maximum of two papers to each reviewer. Papers will be assigned shortly, and the initial review deadline is 1 March 2025 AOE.

We will be using [OpenReview.net](https://openreview.net) with the intention of have an engaging reviewing process inclusive of the whole community.

To respond the invitation, please click on the following link:

<https://openreview.net/invitation?id=ICLR.cc/2025/Workshop/FM-Wild/Reviewers/-/Recruitment&user=vivekmishra%40ieee.org&key=62191acb19e5dae473792ae2bc4d777edb338a7d5115090868cdf79cd2f0c43f>

Please answer within 10 days.

If you accept, please make sure that your OpenReview account is updated and lists all the emails you are using. Visit <http://openreview.net/profile> after logging in.

If you have any questions, please contact fmwild2025@googlegroups.com.

Cheers!

Program Chairs

NeurIPS 2025 Position Paper Track Reviewer Invitation

Vivek Mishra <vivekmishraima@gmail.com>

[NeurIPS 2025 Position Paper Track] Invitation to serve as Reviewer

OpenReview <noreply@openreview.net>
To: vivekmishraima@gmail.com

Sat, Jun 21, 2025 at 12:54 PM

Dear invitee,

We invite you to serve as a Reviewer for the [Annual Conference on Neural Information Processing Systems \(NeurIPS\)](#). As you know, position papers differ significantly from regular research papers in that they argue for a particular (often controversial) opinion or call to action, and they are reviewed according to different criteria. Our goal is to identify those issues and positions that are in need of active engagement and input from the NeurIPS community. We would especially like to include you in the review process due to your expertise and ability to assess position concepts.

Please review the [call for position papers]<https://neurips.cc/Conferences/2025/CallForPositionPapers>), reviewer responsibilities, and planned timeline (below), then let us know if you will accept this invitation within five days.

https://openreview.net/invitation?id=NeurIPS.cc/2025/Position_Paper_Track/Reviewers/-/Recruitment&user=vivekmishra%40ieee.org&key=62191acb19e5dae473792ae2bc4d777edb338a7d5115090868cdf79cd2f0c43f

If you accept, please make sure that your OpenReview account is updated and lists all the emails you are using. Visit <http://openreview.net/profile> after logging in.

NeurIPS reviewer responsibilities:

- Check reviewing assignments and notify the overseeing area chair of any problems (e.g., conflicts of interest).
- Carefully review the assigned submissions to identify strengths and areas for improvement. **Position papers are reviewed with criteria that differ from research papers.**
- Read and acknowledge the Authors' Responses.
- Actively participate in discussions to help reach the best decisions.

Here is a tentative timeline of the reviewing process:

- Reviewer assignment and review period: June 23–July 24, 2025
- *Discussion and meta review period**: July 24–August 28th, 2025
- **Deadline for reviews**: August 28th, 2025
- Author notification: Sept 18, 2025

This year, the main (research) track and position paper track are managed separately. If you have already agreed to serve as a reviewer for NeurIPS (i.e., research track), you should not accept this invitation.

Reviewers are required to meet deadlines, be responsive throughout the reviewing process, and to abide by the [Reviewer Guidelines]

(<https://neurips.cc/Conferences/2020/PaperInformation/ReviewerGuidelines>), which includes details about the review form prompts and ethical conduct rules (including the policy on LLM usage). **Note that the position paper track will use different review criteria from the main track; we will provide instructions.**

In order to improve future reviewer assignments and review quality, the NeurIPS 2025 Program Chairs plan to share the following NeurIPS 2025 reviewing meta-data statistics privately with the program chairs of future NeurIPS and other board-approved venues.

- Total number of reviews assigned to you
- Total number of reviews submitted by you
- Total number of review days late
- Assessments of review and participation quality

Your willingness to share this information with future Program Chairs will improve the health of our scientific field. By accepting this invitation, you consent to the Program Chairs' plan.

Furthermore, all reviewers should receive public credit for their reviewing service to the field, and hence the names of all reviewers (as per [tradition](#)) along with the total number of reviews submitted by each reviewer will be made public.

We know that being a reviewer is a time-consuming service for the machine learning community. NeurIPS needs outstanding people like you to make the conference a success, and we will strive to help you perform these duties as efficiently and effectively as possible. Reviewers who are identified as having done an exceptionally good job in their reviews will be specially recognized and acknowledged at the conference and on the conference website.

If you accept, please also visit <http://openreview.net/profile> to update your OpenReview profile. Most importantly, please fill in all the email addresses you have used, affiliations you have been associated with and DBLP page, in order for us to automatically determine any conflict of interest and assign submissions appropriately.

If you have any questions, please reach out to us at position-track-chairs@neurips.cc.

Thank you for helping to identify the most relevant and well articulated issues of importance to our community. Your efforts matter!

Barbara Engelhardt, Katherine Gorman
NeurIPS 2025 Position Paper Chairs

Vivek Mishra has uploaded review for Differentially Private Decentralized PCA of Graph Signals for Graph Clustering

-- Review Summary --

1. Summary

The paper introduces a decentralized PCA method for graph clustering while ensuring differential privacy. It addresses the challenge of agents having access to only partial graph signals and proposes the Decentralized and Differentially Private Power Method (Dec-DP-Pow) to compute principal eigenvectors securely. By leveraging consensus aggregation, the approach minimizes communication overhead while preserving privacy. Theoretical (ϵ, δ) -differential privacy guarantees are established, and its effectiveness is demonstrated through numerical experiments.

2. Strengths

The proposed method minimizes communication overhead by allowing each agent to track only its local portion of the eigenvectors, reducing data sharing. Its effectiveness is validated through numerical experiments on a stochastic block model graph. Theoretical guarantees are established using Chernoff bounds and composition theorems for differential privacy. Additionally, the privacy-preserving mechanism ensures sensitive graph signals remain protected while enabling accurate clustering.

3. Weaknesses

The paper's scalability remains uncertain as it is tested on a small-scale setup (400 nodes, 4 agents), leaving its performance on larger graphs unexplored. The added differential privacy mechanism may introduce computational overhead, but its impact on efficiency is not thoroughly analyzed. Experimental evaluation is limited, primarily comparing decentralized clustering with centralized k-means, lacking comparisons with other DP-PCA methods. Additionally, the approach assumes graph signal smoothness, which may not be applicable to all real-world datasets.

4. Questions

Can you apply this method to real world dataset like social media?

ACDSA 2026 Reviewer Invitation

Vivek Mishra <vivekmishraima@gmail.com>

Invitation to review submission for The 3rd International Conference on Artificial Intelligence, Computer, Data Sciences and Applications

Microsoft CMT <noreply@msr-cmt.org>
To: Vivek Mishra <vivekmishraima@gmail.com>

Fri, Nov 7, 2025 at 9:32 PM

Dear Colleague,

We hope this email finds you well. We are writing to kindly request your comments on a paper that was recently submitted to the 3rd International Conference on Artificial Intelligence, Computer, Data Sciences and Applications (ACDSA) which will take place in Boracay Island, Philippines on 05-07 February 2026.

www.acdsa.org

We would greatly appreciate it if you could provide your comments on the paper at your earliest convenience. Please address aspects such as originality, methodology, results, organization, clarity, technical soundness, and any strengths or weaknesses you identify. Please try to write at least 20 words for your evaluation.

Please sent your comments no later than 12 November 2025.
Thank you for your cooperation, support and kind help.

Title:

1105: A Multi-Scenario Machine Learning Framework for Predicting 5G Network Quality of Service

Abstract:

Fifth-generation (5G) mobile networks demand dynamic and predictive Quality of Service (QoS) management mechanisms to meet high data rate, low latency, and reliability requirements. However, existing network monitoring systems are predominantly reactive, resulting in inefficiencies in resource allocation and latency optimization. This study proposes an advanced machine learning-based modeling framework for estimating key QoS parameters in 5G networks. The framework models four critical QoS indicators—allocated bandwidth, bandwidth difference, end-to-end latency, and resource allocation ratio—using a dataset of 399 samples collected from real network recordings. Data preprocessing included unit normalization, interaction-based feature extraction, and application-level priority mapping. Five regression algorithms (Random Forest, Gradient Boosting, XGBoost, Ridge, and Linear Regression) were compared. The best-performing models achieved the following results: bandwidth allocation with XGBoost ($R^2 = 0.99$), bandwidth difference with Gradient Boosting ($R^2 = 0.7913$), delay estimation with Random Forest ($R^2 = 0.99$), and resource allocation with Linear Regression ($R^2 = 1.00$). The experimental results demonstrate that the proposed framework achieves high prediction accuracy in critical tasks such as proactive resource scheduling, delay management, and bandwidth optimization. This approach provides data-driven, predictive decision support for network operators, enhancing QoS reliability and significantly improving overall network efficiency.

ACDSA 2026 Paper 1105 Review

Vivek Mishra <vivekmishraima@gmail.com>

ACDSA2026 : Paper 1105

1 message

Microsoft CMT <noreply@msr-cmt.org>
To: Vivek Mishra <vivekmishraima@gmail.com>

Sun, Nov 9, 2025 at 1:29 AM

Vivek Mishra has uploaded review for A Multi-Scenario Machine Learning Framework for Predicting 5G Network Quality of Service

-- Review Summary --

1. Overall Evaluation:

Please provide a detailed review including a justification for your scores. Both the score and the review are required.

Accept

2. Comments for the author:

The paper is well-structured and readable, with clear sections and useful figures/tables. Strengths include the multi-scenario approach and interaction-based features, which meaningfully enhance the models. However, to strengthen the work: (1) Investigate the perfect R^2 for resource allocation provide feature importance (e.g., SHAP values) or correlation matrices to rule out data artifacts. (2) Expand experiments with hyperparameter tuning, larger/synthetic datasets, or comparisons to neural networks for non-linear tasks. (3) Discuss limitations more critically, e.g., the small sample size and potential overfitting despite CV. (4) Add quantitative comparisons to SOTA on similar datasets. Minor issues: Fix inconsistencies in R^2 reporting (abstract vs. results), update the copyright year, and ensure consistent formatting (e.g., umlauts in author names). These changes could elevate it to an accept.

3. Confidential remarks for the organizing committee: (This field is optional)

The Kaggle dataset citation includes an access date of November 6, 2025, while the current date is November 9, 2025 this might indicate a minor typo or forward-dating, but no major concerns. The work seems original based on the content, though a plagiarism check is recommended given the public dataset. Suitable for oral/poster if space allows, but not a highlight paper.

Please do not reply to this email as it was generated from an email account that is not monitored.

To stop receiving conference emails, you can check the 'Do not send me conference email' box from your User Profile.

Bengali Sentiment Analysis Review Invitation

Vivek Mishra <vivekmishraima@gmail.com>

Invitation to review submission for The 6th International Conference on Electrical, Computer and Energy Technologies

1 message

Microsoft CMT <noreply@msr-cmt.org>
To: Vivek Mishra <vivekmishraima@gmail.com>

Tue, Nov 18, 2025 at 5:27 PM

Dear Colleague,

We hope this email finds you well. We are writing to kindly request your comments on a paper that was recently submitted to the 5th International Conference on Electrical, Computer and Energy Technologies (ICECET) which will take place in Rome, ITALY on 06-09 July 2026.

www.icecet.com

We would be honored if you could serve as a reviewer and provide your comments on the paper at your earliest convenience. Please address aspects such as originality, methodology, results, organization, clarity, technical soundness, and any strengths or weaknesses you identify. Please try to write at least 20 words for your evaluation.

Please send your comments no later than 30 November 2025. Your timely feedback will greatly contribute to the preparation of the conference program.

Thank you very much for your valuable time and contribution to ICECET 2026.

Title:

Bengali Sentiment Analysis : Fine-Tuning LLMs and Comparing with Traditional Machine Learning Models for Bengali Movie Review Dataset

Abstract:

-In this study, sentiment analysis of bengali movie review text data based on large language models(LLMs) along with the traditional machine learning approaches. There were some challenges due to linguistic complexity and limited annotated datasets in bengali text. The research leads to satisfy the lack of comparative studies on low-resource languages like Bengali in a systematic way. Bangla Movie and Drama Comments Sentiment Dataset was taken for applying five LLMs so that The usefulness of large language models (LLMs) is shown here and traditional machine learning (ML) also. In this study, fine-tuning five LLMs, including BERT, and RoBERTa which have advanced techniques such as LoRA and mixed-precision training. Additionally, this is compared with ten traditional ML models, including Logistic Regression, Random Forest, and Support Vector Machines. RoBERTa achieves the highest accuracy (88%) and Bert achieves the second highest accuracy (83%). This research provides optimization of bengali movie review sentiment analysis. Depending on the goals, there are always future directions to pursue, such as further development of bangali movie review of datasets.

Senior Member Application Virtual Review Panel - June 2025

Sunday, 29 June 2025

8:30 AM CDT - 5:00 PM CDT

June 2025 Senior Member Application Virtual Review Panel

Dear Vivek Mishra,

*****Please note, this is a virtual invite only. You will be working remotely at your own personal location*****

On behalf of Howard Wolfman, 2025 Chair of the IEEE Admission and Advancement (A & A) Committee, you are invited to attend the upcoming Senior Member Review

Panel Meeting to be held **virtually** on Sunday, 29 June 2025 from 8:30 AM CDT until 5:00 PM CDT.

To support you in your efforts, the IEEE Senior Member Team will be available on Webex, from 8:30 AM CDT through 5:00 PM CDT on 29 June 2025.

You must log on to the Webex at 8:30 AM CDT on 29 June for a brief overview and training session before you start.

The deadline to register for this meeting is Sunday, 22 June 2025.

Including this virtual review panel, this year there will be at least nine (9) IEEE A & A Review Panel Meetings as part of the Membership Geographic Activities Senior Member program. Only Senior Members and Fellows are eligible to attend.

Important! In order to participate in the Virtual Panel Meeting you will need to have the latest version of either Google Chrome or Mozilla Firefox installed on your computer.

To register for this event and for more information, please click on the link below. Those who register will receive an email confirmation.

Should you have any questions or comments, please contact:

IEEE Member and Geographic Activities Department
senior-member@ieee.org

When: Sunday, 29 June 2025, 8:30 AM CDT until 5:00 PM CDT

Where: Virtual Panel Meeting

What you Need: A computer (Windows or macOS) with the current version of Google Chrome or Mozilla Firefox installed & Availability to Review Applications on Sunday, 29 June 2025

Registration Deadline: Sunday, 22 June 2025

Yes

No

We look forward to your participation in the Senior Member Application Virtual Review Panel - June 2025.

Regards,

Senior Member Team

IEEE

501 Hoes Lane

Exhibit JR-13

IEEE Senior Member Panelist Thank You Letter

vivekmishraima@gmail.com

29-June-2025

Dear Vivek Mishra,

I would like to thank you for the assistance you provided to the A&A Committee panel in reviewing a large number of Senior Member applications. Your contribution of time and effort is greatly appreciated. Through your participation, you have helped to accomplish the mission and goals of the Admission and Advancement Committee and have been instrumental in making possible the elevation of deserving IEEE Members to Senior Member status.

The Senior Member Program is one of our most vital membership development initiatives and one that brings prestige to the successful candidates, their employers, and to the IEEE as well. Now that you are more aware of the requirements for Senior Member elevation, I would like to encourage you to nominate worthy colleagues so that they, too, can reap the benefits of Senior Membership. For more information, please visit

<http://www.ieee.org/seniormember>.

In addition, if you are interested in participating in another virtual panel meeting this year, we would appreciate you completing this very brief survey. PLEASE NOTE, THIS SURVEY IS FOR THE 2025 YEAR. IF YOU HAVE PREVIOUSLY FILLED OUT THIS FORM IN 2024, YOU MUST FILL OUT THIS FORM AGAIN IN ORDER TO SERVE IN 2025.

<https://forms.gle/fL6DRGDjVnhYxyqBA>

Thank you again for your contribution and your commitment to supporting our professional society. I look forward to working with you again in the future as we continue to serve the needs of the IEEE and its members.

Sincerely,

Howard Wolfman, Chair
IEEE Admission and Advancement Committee

Mon, Nov 11, 2024 at 7:55 AM

Dear Vivek,
I am writing in case you haven't received my previous email.

I hope you are doing well. I would greatly appreciate it if you as **the external reviewer** of the *Risk Governance and Control: Financial Markets & Institutions* journal review the paper submitted to the journal (you may find it enclosed).

We expect to see a report (text) of 200-300 words describing the major issues of the paper including the conceptual fundamentals, literature review, research framework (if any) and paper results (conclusion) and general advice to accept the paper (with additional revision or not) or to be rejected.

You can use the form attached below for the report or provide your comments in a different form.

I would appreciate if you give me the feedback by **November 20**.

Please let me know if you will be able to review the paper.

Best regards,
Olha

Dear Vivek,

I hope you are doing well. I would greatly appreciate it if you as **the external reviewer** of the *Corporate & Business Strategy Review* journal review the paper submitted to the journal (you may find it enclosed).

We expect to see a report (text) of 200-300 words describing the major issues of the paper including the conceptual fundamentals, literature review, research framework (if any) and paper results (conclusion) and general advice to accept the paper (with additional revision or not) or to be rejected.

You can use the form attached below for the report or provide your comments in a different form.

I would appreciate if you give me the feedback by **October 17**.

Please let me know if you will be able to review the paper.

Best regards,
Olha

--

**Olha Lytvynenko**

Senior Managing Editor, Managing Editor of the journals "Corporate Ownership and Control", "Journal of Governance and Regulation", "Risk Governance and Control: Financial Markets & Institutions", and "Corporate & Business Strategy Review"

Dear Vivek Mishra,

I believe that you would serve as an excellent reviewer of the manuscript, "An Operational Risk Prediction Method for Corporate Financial Management Based on Big Data Analysis," which has been submitted to Informatica. The submission's abstract is inserted below, and I hope that you will consider undertaking this important task for us.

Please log into the journal web site by 2024-10-14 to indicate whether you will undertake the review or not, as well as to access the submission and to record your review and recommendation.

The review itself is due 2024-11-17.

Submission URL:

<https://www.informatica.si/index.php/informatica/reviewer/submission/6343?key=kU2VRSrB>

Thank you for considering this request.

Kind regards,

Tine Kolenik

"An Operational Risk Prediction Method for Corporate Financial Management Based on Big Data Analysis"

Abstract

The information source of financial management operation data comes from financial statements, accounting records, and other aspects. The amount of data is large, which increases the calculation amount of the risk prediction algorithm. To reflect the business operation status and risk changes promptly, provide comprehensive and multi-dimensional risk information, use the advantage of big data scrutiny to quickly deal with massive data, and propose a prediction method for business financial management operation risk based on big data analysis. Through data cleaning, standardization, discretization, fuzzy rough set mining, and other steps to preprocess the enterprise financial management operation data, remove the noise and redundant information in the original data, and process incomplete and uncertain data to obtain reduced and reduced dimension enterprise financial management operation data; On this basis, select a variety of risk indicators, and use the gray system model to extract key enterprise financial management operational risk indicators. The enterprise financial management operational risk indicators are input into the SVM model as training samples. Under the constraints of the SVM classification model, the classification hyperplane is established, and the outcomes of enterprise financial handling operational risk prediction are obtained. The particle swarm optimization algorithm is used to optimize the predefined parameters and cost parameters of the kernel function in the SVM model to improve the accuracy of risk prediction. The experimental findings demonstrate that this approach possesses excellent feasibility and accuracy. It can not only

accurately predict the risk level of the enterprise, but also the prediction results are highly stable and reliable. The method also has strong robustness and is suitable for long-term risk prediction. While the prediction time is short, it can also ensure a better balance between the generalization ability and performance of the model, and provide an efficient and practical risk management tool for enterprises.

"Consumer behavior and enterprise marketing strategy based on big data analysis"

Abstract

With the development of big data technology, enterprises are facing a more complex market environment, and the behavior pattern of consumers has become difficult to predict. Based on big data analysis, this study explores the relationship between consumer behavior patterns and corporate marketing strategies. Through the combination of decision tree model and association rule algorithm, we analyze the purchasing behavior of 1000 consumers in Shenyang City, and find that personalized marketing and dynamic pricing strategy can significantly improve sales growth and customer loyalty. The sales growth rate of dynamic pricing strategies reached 16.7%, and the customer buyback rate of personalized promotions was 10.5%. Research shows that enterprises can optimize marketing strategies, enhance market competitiveness and customer loyalty through accurate consumer behavior analysis.

"Improved Performance of CNN Classifier Based Face Recognition Against Variant Conditions"

Abstract

Face recognition is a critical task in various applications, such as surveillance, security, and human-computer interaction. Recently, Convolutional Neural Networks (CNNs) have emerged as a powerful tool for face recognition, outperforming traditional methods in many scenarios. However, the performance of CNN-based face recognition systems can be affected by various conditions, such as pose, illumination, and occlusion. This paper aims to investigate the performance of a CNN-based face recognition classifier under different challenging conditions. The study evaluates the effectiveness of various architectural choices for CNN-based face recognition systems and evaluates their performance CNN classifier on different datasets with varying levels of illumination conditions, image quality, face poses, and facial expressions. The findings suggest that by carefully designing the CNN architecture and incorporating techniques to improve information propagation, the performance of the face recognition system can be enhanced, even under adverse conditions. The obtained results show an improved level of accuracy in which the proposed system achieved 94.82%.

"Video Super-Resolution Reconstruction Technology Based On Deep Learning Algorithm"

Abstract

With the increasing demand for high-definition video, video super-resolution technology has become a key means to improve video picture quality. Traditional video super-resolution methods are limited by computational resources and model complexity, which are difficult to meet the demands of modern video processing. In recent years, the rise of deep learning technology has brought a revolutionary breakthrough for video super-resolution. In this paper, we propose a deep learning video super-resolution reconstruction method combining Transformer, cross-modal learning and fusion, and attention mechanism in this context. We design the Temporal Transformer-based Video Super-Resolution (TT-VSR) architecture, which significantly improves the accuracy and detail richness of video reconstruction by integrating the Transformer's self-attention mechanism and the CNN's spatial feature extraction capability. The introduction of cross-modal learning and fusion as well as cross-modal attention mechanism further enhances the model's adaptability to complex scenes and detail recovery ability. The experimental results show that our model exhibits excellent performance in multiple dimensions and opens a new path for the development of video super-resolution technology.

"Applying Mathematical Modeling Optimization Algorithms to Solve Shop Floor Scheduling Problems"

Abstract

Shop floor scheduling is an important optimization problem in modern manufacturing. Its goal is to rationalize production tasks and resources, improve productivity and reduce costs. In this paper, we propose a solution to the shop floor scheduling problem based on mathematical modeling and optimization algorithms. First, this paper develops a comprehensive mathematical model to capture the complex features of the problem, including machine assignment, job sequencing, batch transportation, and assembly operations. In order to efficiently solve the shop floor scheduling problem with mixed-model assembly operations, an enhanced simulated annealing (SA) algorithm is proposed, which employs various improvement strategies such as knowledge-driven initialization, problem-specific neighborhood structure, and restart mechanism. Experimental results show that our method can significantly reduce the total processing time and delay time and improve the productivity of the shop floor compared with traditional scheduling methods. The research results in this paper are of great theoretical and practical significance for solving practical shop floor scheduling problems.

"Implementation of Abnormal Access Behavior Detection Algorithm Based on Generative Adversarial Networks"

Abstract

Along with the continuous development of information technology, the database has become an important module for enterprises and individuals to apply computers, and some important data are stored in the database, which also leads to the database becoming the target of malicious intruders. The

abnormal access behavior detection algorithm for data can quickly identify abnormal access situations, timely intervention and processing to ensure data security. Based on this, this paper proposes an abnormal defense behavior detection algorithm based on generative adversarial network, the new algorithm has the applicability as well as two derivative models of generative adversarial network for network abnormal access detection with high efficiency.

"High-precision Photogrammetric 3D Modeling Technology Based on Internet of Things Big Data"

Abstract

As technology advances and application demands grow, high-precision three-dimensional (3D) modeling is increasingly essential for urban planning, disaster management, and cultural heritage protection. To address these needs, this study presents a high-precision photogrammetric 3D modeling approach with a specific focus on the integration of multi-source data fusion techniques in complex terrains. The methodology integrates aerial imagery, LiDAR data, ground survey data, and meteorological corrections. It covers the entire workflow from data preprocessing, feature extraction, and registration to multi-source data fusion. Key innovations include the use of an adaptive weight adjustment strategy, global optimization registration techniques, and deep learning-assisted feature learning, all of which contribute to significant enhancements in model accuracy and reliability. Experimental results demonstrate notable improvements in spatial accuracy, morphological structure recovery, visual effects, and practical application performance. These improvements have been well-received by users. However, specific technical details, such as the algorithms used for data fusion and quantitative metrics supporting the improvement claims, should be provided for a comprehensive understanding of the methodology and its efficacy.

PennApps Judge Certification Letter (University of Pennsylvania)

To Whom It May Concern:

This letter confirms that Vivek Mishra was selected as a Judge for PennApps XXV, one of the world's largest and most prestigious collegiate hackathons. PennApps took place at the University of Pennsylvania School of Engineering from Friday, September 20th, 2024, to Sunday, September 22nd, 2024, with more than 500+ participants (from universities across the globe) on-site across college students, mentors, judges, and sponsor representatives.

Vivek played a crucial on Sunday morning to afternoon in helping to evaluate the more than 100 project submissions we received during the weekend. They watched project pitches from our teams, evaluated their project code and presentation based on their technical and product expertise, asked critical follow-up questions, and gave invaluable feedback to help these young minds further develop their skills. They overall played a key role in fostering an environment where students felt inspired by role models from various engineering disciplines.

PennApps received numerous applications from professionals across various industries, and Vivek's distinguished expertise in their field set them apart as an ideal candidate to evaluate the innovative projects that participants will develop. Their insights and experience were invaluable in recognizing the most impactful and forward-thinking solutions at the event.

PennApps XXV convened some of the brightest minds from universities worldwide, providing a platform for groundbreaking technological advancements and creative problem-solving. Our judges played a critical role in guiding and mentoring these young innovators, while also having the opportunity to network with other leading experts in the tech industry.

Primary Contact	Lina Chihoub, PennApps Director	lina@pennapps.com, +1-609-213-6297
-----------------	---------------------------------	------------------------------------

PennApps is greatly appreciative of the valuable contributions that Vivek made. Any questions or requests for further information can be directed to the contacts provided.

Lina Chihoub
Director, PennApps

Dear Mr. Mishra,

I hope this message finds you well. I am writing to you on behalf of the Dragon Hacks Committee to extend a formal invitation for your participation in our upcoming hackathon event as a judge/mentor. This year marks a decade of fostering innovation and creativity among students and professionals alike, and your contribution as a judge or mentor would be invaluable.

Event Details:

Name: Dragon Hacks 2024

Location: Drexel University, Bossone College of Business

Date: April 13th to April 14th

Duration: 11AM - 4PM

Purpose: Your expertise and experience would greatly contribute to the success of our event, as we value your role in judging and mentoring the participants.

Please find all relevant details and the link to our hackathon below:

www.dragonhacks.org

We believe your involvement will not only enrich the experience of our participants but also provide an opportunity for professional networking and growth. I have CC'd your Gmail address as requested and will ensure to keep it in the loop for all further communications.

Thank you for considering participating in Dragon Hacks 2024. We are looking forward to potentially having you as a part of our event. Please reply to this email with your availability to confirm your presence.

Warm regards,

Anomitro Paul

Dragon Hacks Co-ordinator

MORGAN HACKS

Innovate | Create | Launch

To Whom It May Concern,

I am writing to formally acknowledge the pivotal role of Vivek Mishra as a judge at the 2nd annual MorganHacks Competition held on April 6th - 7th, 2024.

Vivek's involvement as a judge was instrumental in the success of MorganHacks. His expertise and insights significantly contributed to the evaluation process, ensuring the quality and fairness of the competition.

Here are further details regarding Vivek's participation in MorganHacks:

Event Name: MorganHacks

Event Date: April 7, 2024

Vivek's Role: Judge

Number of Participating Teams: 39

Total Attendance: 143 participants

MorganHacks is an annual hackathon aimed at fostering innovation and collaboration among students from various universities. This year, the event gathered a diverse range of participants, each showcasing their creativity and problem-solving skills to address real-world challenges.

Should you require any additional information or clarification, please do not hesitate to contact us. We are committed to providing any assistance you may need.

Keywords: Automated Scientific Discovery, AI for Science, Science of Science

TL;DR: AI-driven automated scientific discovery marks the future trajectory of Science of Science research.

Abstract:

The Science of Science (SoS) explores the mechanisms underlying scientific discovery, and offers valuable insights for enhancing scientific efficiency and fostering innovation. Traditional approaches often rely on simplistic assumptions and basic statistical tools, such as linear regression and rule-based simulations, which struggle to capture the complexity and scale of modern research ecosystems. The advent of artificial intelligence (AI) presents a transformative opportunity for the next generation of SoS, enabling the automation of large-scale pattern discovery and uncovering insights previously unattainable. This paper offers a forward-looking perspective on the integration of Science of Science with AI for automated research pattern discovery and highlights key open challenges that could greatly benefit from AI. We outline the advantages of AI over traditional methods, discuss potential limitations, and propose pathways to overcome them. Additionally, we present a preliminary multi-agent system as an illustrative example to simulate research societies, showcasing AI's ability to replicate real-world research patterns and accelerate progress in Science of Science research.

📄 Revisions (/revisions?id=oTIQBkUn0v)

Ethics:

No ethical violations or concerns.

Strengths:

The paper explores the intersection of AI and scientific research. Reviewers consider it to be of high quality and note the strong relevance of the topic. They also highlight positively that it combines theoretical and empirical support, incorporating simulations as well as references to real-world data, thereby presenting a compelling case.

Weaknesses:

The length of the paper and the scope of the discussions and experiments is criticised, e.g., one reviewer mentions that "experimental validation seems quite preliminary and limited in its scope" or that the paper "does not discuss scientific research that requires physical experiments". Similarity to some existing perspective articles about the topic is also mentioned.

Questions:

Reviewers ask for some more detailed discussion about the risks and negative sides of the vision presented in the paper.

Agreement: 4: agree**Rating:** 8: Strong Accept: The paper presents a strong argument about an important issue that ought to be discussed and is of importance to a sub-area within the NeurIPS community.**Confidence:** 3: You are fairly confident in your assessment. Official Review by Reviewer 3VY2 📅 07 Aug 2025, 02:50 (modified: 28 Oct 2025, 23:03) 👁 Everyone

📄 Revisions (/revisions?id=57eh9aM2dX)

Ethics: NO or VERY MINOR ethics concerns only**Position:** Yes, the paper argues for or against a position related to machine learning.**Summary:**

This paper offers a forward-looking perspective on the integration of Science of Science with AI for automated research pattern discovery and highlights key open challenges that could greatly benefit from AI. The authors discussed the forecasting trends in technology and innovation, and analyzed the evolution of research communities. It is a forward-looking paper

Author Identification: No.**Support:** 4: excellent**Significance:** 3: good**Presentation:** 3: good**Context:** 2: fair**Discussion:** 3: possibly**Alternative Position:** Yes, and alternative positions are trivial straw-man arguments

Strengths:

The authors has well described the flow chart of the Human-Driven research process and the AI-Driven research process in Figure 1, which well illustrates that AI has the potential to revolutionize SoS. And the authors defines AI for Science and AI for Science of Science very well in Table 1.

Weaknesses:

1. The author does not discuss scientific research that requires physical experiments, such as biology, chemistry, and other scenarios that require hands-on experiments, and discusses the role of Embodied AI and robots in Science of Science Research.
2. In section 2.2, Automation Degree in AI4SoS is somewhat similar to some existing perspective articles. The author needs to discuss their similarities and differences in the article: "Transforming science labs into automated factories of discovery", "Scaling Laws in Scientific Discovery with AI and Robot Scientists", "Empowering biomedical discovery with AI agents".

Questions:

Similar to the question in Weaknesses, the author did not discuss AI and robots conducting autonomous experiments in the physical world. I wonder what role and function robots will play in SoS?

Agreement: 4: agree

Rating: 8: Strong Accept: The paper presents a strong argument about an important issue that ought to be discussed and is of importance to a sub-area within the NeurIPS community.

Confidence: 5: You are absolutely certain about your assessment. You are very familiar with the related work.

Thoroughness: 5: You read the paper and appendices rigorously and checked all of the details carefully, including references and proofs (if present).

Code Of Conduct Acknowledgement: Yes

Add: **Official Comment**

Official Review of Submission110 by Reviewer URur

Official Review by Reviewer URur 📅 23 Jul 2025, 10:43 (modified: 28 Oct 2025, 23:03) 👁 Everyone

📄 Revisions (/revisions?id=b4vBAwxUnz)

Ethics: Major Concern: Discrimination, bias, and fairness

Details Of Ethics Concerns:

The paper dives deep into the issue of bias in AI systems, highlighting the uneven distribution of data across various fields and how this can amplify existing inequalities in scientific research. While the authors do recognize these challenges and suggest ways to address them, the core issue of AI systems potentially reinforcing biases in scientific discovery really calls for an ethics review. Additionally, the simulation of research communities brings up further concerns about how well diverse scientific groups are represented.

Position: Yes, the paper argues for or against a position related to machine learning.

Summary:

This paper makes a strong case for using AI-driven automation as the cornerstone of next-generation Science of Science (SoS) research. The authors contend that the traditional SoS methods, which rely on basic statistical tools, just don't cut it anymore given the complexities of modern research. They introduce AI4SoS as a unique field, outline a 5-level hierarchy of automation that ranges from no automation to fully automated discovery, and share some initial findings from a multi-agent system that simulates scientific collaboration. The main takeaway is that AI has the potential to revolutionize SoS by uncovering patterns automatically, leading to insights that manual methods simply can't achieve.

Author Identification: No.

Support: 2: fair

Significance: 3: good

Presentation: 2: fair

Context: 3: good

Discussion: 3: possibly

Alternative Position: Yes, and alternative positions are well-considered and named but not addressed

Strengths:

The paper dives into a crucial intersection between AI and scientific research. It introduces a 5-level hierarchy that serves as a helpful framework for grasping how AI automation fits into the Science of Science. The authors clearly differentiate between AI4S and AI4SoS, which is well explained. Their extensive literature review reflects a deep understanding of the field. Additionally, the initial multi-agent simulation indicates that they've thoughtfully considered the practical aspects of their proposed approach. They also recognize the significant challenges ahead, such as bias, evaluation hurdles, and the complexity of systems.

Weaknesses:

The paper feels a bit too lengthy and technical for what's meant to be a position paper that sparks wide-ranging community discussion. The experimental validation seems quite preliminary and limited in its scope. It doesn't really tackle the essential questions about whether fully automated scientific discovery is something we actually want or if it's even possible. Plus, the exploration of alternative viewpoints is pushed off to an appendix instead of being woven into the main argument. Some of the claims regarding AI's transformative potential don't seem to have enough empirical backing. Also, the emphasis on the Science of Science might be a bit too narrow for the diverse NeurIPS audience.

Questions:

How do the authors tackle the worries that fully automated scientific discovery could diminish human insight and the happy accidents that often lead to significant breakthroughs?

What specific measures are in place to ensure that AI4SoS systems don't reinforce or worsen existing biases in scientific publishing and collaboration?

How would the suggested framework deal with fields that have limited data or research methods that can't be easily quantified?

Is there any evidence that the 5-level hierarchy truly reflects the natural evolution of AI automation in scientific research?

Agreement: 3: neither agree nor disagree

Rating: 6: Weak Accept: The paper presents a solid argument about an issue of moderate importance to at least one sub-area of the NeurIPS community.

Confidence: 4: You are confident in your assessment, but not absolutely certain. It is unlikely, but not impossible, that you did not understand some parts of the submission or that you are unfamiliar with some pieces of related work.

Thoroughness: 4: You read the paper and appendices and checked most of the details, including references..

Code Of Conduct Acknowledgement: Yes

Official Review of Submission110 by Reviewer FFXE

Official Review by Reviewer FFXE (👤 Vivek Kumar Mishra (/profile?id=~Vivek_Kumar_Mishra1))

📅 08 Jul 2025, 21:21 (modified: 28 Oct 2025, 23:03) 👁 Everyone 📄 Revisions (/revisions?id=V7IgtIU30v)

Ethics: NO or VERY MINOR ethics concerns only

Position: Yes, the paper argues for or against a position related to machine learning.

Summary:

This paper puts forward a timely and ambitious perspective on how artificial intelligence particularly large language models and multi-agent systems can reshape the Science of Science (SoS) field. It introduces a structured framework called AI4SoS, outlining five levels of automation in studying scientific progress, from fully manual analysis to fully autonomous discovery. The authors argue that AI can go beyond supporting individual tasks to simulating entire research ecosystems, enabling better understanding of research trends, collaboration patterns, and innovation triggers.

To support this, the paper presents a proof-of-concept multi-agent simulation that models a research society and evaluates how factors like diversity and institutional ranking relate to citation outcomes. While still in early stages, the results show promising alignment with real-world patterns. The paper also discusses key challenges such as data bias, system evaluation, and explainability and proposes thoughtful strategies to address them. Overall, it makes a strong case for why AI could play a foundational role in the next generation of SoS research.

Author Identification: No.

Support: 4: excellent

Significance: 4: excellent

Presentation: 3: good

Context: 4: excellent

Discussion: 4: very likely

Alternative Position: Yes, and alternative positions are well-considered and addressed by the argument

Strengths:

Offers both theoretical and empirical support, including simulations and references to real-world data Introduces a compelling case for why AI can revolutionize how scientific collaboration and innovation are understood.

Weaknesses:

The paper is dense in parts, especially where it explains the technical systems and hierarchy levels. A bit more clarity or simplification in those sections would help more readers engage with the ideas. Finally, while ethical risks like bias and fairness are mentioned, the paper could say more about how we ensure humans stay involved when these AI systems get really powerful.

Questions:

How can we make sure these AI systems don't just reinforce the current winners in science—like elite institutions or already famous researchers—while missing out on new or underrepresented voices?

As AI takes over more parts of the research cycle, how can we make sure it's still helping people discover new things rather than just optimizing for what already works?

Agreement: 4: agree

Rating: 8: Strong Accept: The paper presents a strong argument about an important issue that ought to be discussed and is of importance to a sub-area within the NeurIPS community.

Confidence: 4: You are confident in your assessment, but not absolutely certain. It is unlikely, but not impossible, that you did not understand some parts of the submission or that you are unfamiliar with some pieces of related work.

Thoroughness: 5: You read the paper and appendices rigorously and checked all of the details carefully, including references and proofs (if present).

Code Of Conduct Acknowledgement: Yes

Keywords: Power System, energy forecasting, time series, interdisciplinary study

Abstract:

Modern power systems are undergoing profound transformations driven by decarbonization, decentralization, and digitalization, which introduce significant complexities and challenges for energy forecasting. Although existing AI techniques have shown success in general time series forecasting (TSF), they overlook the unique characteristics and requirements of power systems. This position paper highlights the critical need for tailored solutions to enhance the accuracy and robustness of energy forecasting. We propose novel directions from three key perspectives: (1) **Decarbonization:** Physics-informed and probabilistic forecasting methods to account for the uncertainty brought by renewable energy, with a focus on extreme weather scenarios. (2) **Decentralization:** Cost-oriented and distributed forecasting approaches, along with edge intelligence techniques, to facilitate stakeholders' decision-making and enable efficient edge-device-based forecasting. (3) **Digitalization:** Hierarchical, explainable, and interactive forecasting frameworks to leverage multi-granular data resources while ensuring the usability and interpretability of energy forecasting systems. We aim to bridge the gap between AI advancements and the evolving needs of power systems, calling for increased focus on interdisciplinary research to develop practical and effective energy forecasting techniques.

Official Review of Submission156 by Reviewer 5XL3

Official Review by Reviewer 5XL3 📅 08 Aug 2025, 17:36 (modified: 15 Aug 2025, 14:46)

👁 Program Chairs, Area Chairs, Reviewers Submitted, Reviewer 5XL3, Authors

📄 Revisions (/revisions?id=NAbJKzmmBj)

Ethics: NO or VERY MINOR ethics concerns only

Details Of Ethics Concerns:

No human subjects, datasets, or deployable models are released. Minor risks worth acknowledging: (i) privacy from fine-grained meter/DER data and cross-entity collaboration. The paper itself notes that energy data are sensitive and that some privacy-preserving techniques are only partial fixes, which raises governance/consent questions if future work aggregates customer data, (ii) incorrect forecasts can propagate to operations/markets and affect grid stability and costs, which the paper frames as high-stakes (blackout/instability), (iii) representativeness and distribution shift under decarbonization/extreme weather. Future empirical work should report calibration and stress tests across climates and rare events, and (iv) if LLM use is adopted as interfaces or predictors, hallucination/accountability must be managed with verifiable back-ends and auditability.

I'm not requesting an ethics review as these are low-level concerns appropriate for author response/revision. The paper should (a) state a privacy posture (e.g., DP + secure aggregation + access control) for any future data sharing, (b) commit to compute/energy disclosure if training large models or edge deployments are evaluated later, and (c) specify operator-in-the-loop guardrails and verification for any LLM-mediated workflows.

Position: Yes, the paper argues for or against a position related to machine learning.

Summary:

The paper argues that generic time-series forecasting (TSF) is insufficient for modern power systems due to the pressures of decarbonization, decentralization, and digitalization. It motivates the problem by the operational and economic stakes of grid management and structures its position around three directions. The first is (i) physics-informed and probabilistic forecasting, with emphasis on robustness to extreme weather. The second is (ii) cost-aware, distributed, and edge-based forecasting to support decision-making by diverse stakeholders. The third is (iii) hierarchical, explainable, and interactive forecasting methods. The work surveys the current TSF literature and its applications in power systems and highlighting limitations of these approaches. It then calls for interdisciplinary methods that integrate grid physics, market dynamics, and multi-level decision processes into AI-driven forecasting.

Author Identification: No.

Support: 2: fair

Significance: 3: good

Presentation: 3: good

Context: 3: good

Discussion: 3: possibly

Alternative Position: Yes, and alternative positions are well-considered and named but not addressed

Strengths:

The paper has a clear thesis. It posits that generic TSF is mismatched to modern power systems. The decarbonization/decentralization/digitalization lenses are the right ones and are explained accessibly. The paper synthesizes several relevant directions, including physics-informed learning, probabilistic calibration, decision/cost-aware objectives, distributed/edge settings, hierarchical reconciliation, and operator-facing interpretability/LLM interfaces. It situates them against grid problems (uncertainty, multi-stakeholder ownership, privacy, extreme weather). The writing is organized and readable. The figures help set the scope. The survey touchpoints are broad and current enough to be useful to ML readers entering the area. As a community piece, it can spark discussion across ML + power systems.

Weaknesses:

What I was expecting was a clear, formal problem statement. That is, a mathematical setup that ties the "tailored AI" vision directly to the structure and constraints of energy systems, so that a reader could see exactly how the learning objective changes once grid physics, markets, and decentralization are taken into account. Instead, what the paper gives you are mostly descriptions of challenges and promising directions. They outline physics-informed learning, probabilistic calibration, edge forecasting, hierarchy, interpretability, etc., but these are narrated as high-level features of good solutions, not encoded into a concrete optimization problem.

For example, you were looking for something like:

$\min_{\theta} \mathbb{E}[C(x^{\hat{y}(\theta)})] \quad \text{s.t.} \quad x^{\hat{y}(\theta)} \text{ satisfies OPF constraints}$,

plus bilevel or fixed-point price–demand models, explicit hierarchical aggregation constraints S , federated/personalized learning terms, and NWP-conditioned uncertainty scoring (CRPS, PIT). That would operationalize the “tailored AI” into a specific, trainable formulation.

What you got instead was a narrative saying “we need decision-coupled models, market-aware learning, hierarchical reconciliation, etc.”

Questions:

1. Specify which TSF assumptions (stationarity, exogeneity, single-agent, i.i.d.) are violated in grids, and map each violation to a required modeling change.
2. Will you adopt a decision-focused training objective with a differentiable OPF/dispatch layer? If not, why?
3. How do you formalize price/demand feedback—bilevel optimization, fixed-point, or simulators with implicit differentiation?
4. For hierarchy, do you advocate end-to-end coherence losses or post-hoc reconciliation, and why?
5. What is your near-term stance on LLMs: interface/agent with verifiable back-ends, or forecaster? What verification/audit mechanisms are assumed?

Agreement: 2: disagree

Rating: 4: Borderline reject: The paper presents a position, but the reasons to reject, e.g., unclear reasoning or limited support for the claims, outweigh reasons to accept.

Confidence: 4: You are confident in your assessment, but not absolutely certain. It is unlikely, but not impossible, that you did not understand some parts of the submission or that you are unfamiliar with some pieces of related work.

Thoroughness: 5: You read the paper and appendices rigorously and checked all of the details carefully, including references and proofs (if present).

Code Of Conduct Acknowledgement: Yes

Add: **Official Comment**

Official Review of Submission156 by Reviewer bZRL

Official Review by Reviewer bZRL 📅 06 Aug 2025, 01:15 (modified: 15 Aug 2025, 14:46)

👁 Program Chairs, Area Chairs, Reviewers Submitted, Reviewer bZRL, Authors

📄 Revisions (/revisions?id=EggoAlekd8)

Ethics: NO or VERY MINOR ethics concerns only

Position: Yes, the paper argues for or against a position related to machine learning.

Summary:

The primary position taken by this paper is to advocate for the development of novel Time Series Forecasting (TSF) methods to improve energy forecasting, which is critical for managing modern electricity grids. The paper shows that the evolution of electricity grids can be viewed through the perspective of 3 areas: decarbonization, decentralization, and digitalization. In this context, it discusses prevailing issues, existing approaches and their limitations, as well as potential research directions specific to each area. Within each area, the paper discusses how each area of evolution has introduced its own unique challenges (for instance, decarbonization has introduced energy sources that have very dynamic supply patterns, making it difficult to make predictions with traditional TSF methods). Finally, the paper’s overall viewpoint is that due to the introduction of numerous internal and external variabilities, existing TSF systems are inadequate for making accurate forecasts and decisions. Therefore, there is a need to develop more practical and robust TSF methods for energy forecasting.

Author Identification: No.

Support: 4: excellent

Significance: 3: good

Presentation: 3: good

Context: 4: excellent

Discussion: 3: possibly

Alternative Position: Yes, and alternative positions are well-considered and addressed by the argument

Strengths:

A significant strength of this paper is its structured approach. It divides its argument into 3 specific areas of evolution, offering a critical analysis and proposing effective solutions for each one. In each of these specific areas, the authors discuss relevant literature as a way to highlight current limitations and to describe potential solutions. Finally, the authors also summarize their position for each area of evolution, which solidifies the overall position and viewpoint of the paper.

Weaknesses:

I believe the paper effectively presents its viewpoint, however, it could place more emphasis on how TSF methods can be designed or optimized for different stakeholders. For instance, energy distributors might prioritize optimizing for reduced costs, while environmental agencies might be more interested in increasing the contribution of renewable energy sources to total power generation. While the paper briefly touches on this in the cost-oriented forecasting section, this might be a relevant topic for readers and could have been explored further in the paper.

Questions:

I would definitely encourage the authors to think about how different stakeholders might design or optimize their TSF methods based on their specific concerns

Agreement: 4: agree

Rating: 6: Weak Accept: The paper presents a solid argument about an issue of moderate importance to at least one sub-area of the NeurIPS community.

Confidence: 4: You are confident in your assessment, but not absolutely certain. It is unlikely, but not impossible, that you did not understand some parts of the submission or that you are unfamiliar with some pieces of related work.

Thoroughness: 4: You read the paper and appendices and checked most of the details, including references..

Official Review of Submission156 by Reviewer hbrz

Official Review by Reviewer hbrz (👁 Vivek Kumar Mishra (/profile?id=~Vivek_Kumar_Mishra1))

📅 22 Jul 2025, 07:42 (modified: 15 Aug 2025, 14:46)

👁 Program Chairs, Area Chairs, Reviewers Submitted, Reviewer hbrz, Authors

📄 Revisions (/revisions?id=NU6LTBn2Gj)

Ethics: NO or VERY MINOR ethics concerns only

Position: Yes, the paper argues for or against a position related to machine learning.

Summary:

This position paper argues that modern power systems, shaped by decarbonization, decentralization, and digitalization, need specialized AI for energy forecasting. Regular AI time series forecasting methods don't fully address the challenges of renewable energy's variability, distributed systems, or digital data complexity. The paper reviews current forecasting methods, identifies gaps, and suggests new approaches: (1) physics-informed and probabilistic models for decarbonization, (2) cost-oriented and edge-based forecasting for decentralization, and (3) hierarchical and explainable models for digitalization. It emphasizes combining data-driven and physics-based models, addressing privacy, and improving forecasting under extreme weather. The goal is to spark discussion and guide future research for better, trustworthy energy forecasting in the NeurIPS community.

Author Identification: No.

Support: 4: excellent

Significance: 4: excellent

Presentation: 3: good

Context: 4: excellent

Discussion: 4: very likely

Alternative Position: Yes, and alternative positions are well-considered and addressed by the argument

Strengths:

The paper connects AI and energy forecasting really well. It clearly explains why off-the-shelf AI tools aren't enough anymore. It breaks down the key issues in modern power systems and gives a structured plan with examples to fix them. It's ambitious and well-thought-out.

Weaknesses:

The paper could improve by adding real-world case studies or examples to make its ideas more concrete. It's heavy on technical terms, so simplifying some language would help reach a broader audience. It also repeats some points (like decentralization challenges) across sections, which could be streamlined. An alternative position not fully explored is the potential of purely data-driven models with massive datasets, which some argue could outperform hybrid models in certain cases. Another angle could be the cost or feasibility of implementing complex AI models in real-world power systems, especially for smaller grids.

Questions:

Can you share examples of real-world power systems where tailored AI forecasting has been successfully implemented? How do you balance the computational cost of physics-informed models with practical deployment in resource-constrained settings like edge devices? Are there specific datasets or benchmarks you'd recommend for testing these tailored AI methods?

Agreement: 4: agree

Rating: 8: Strong Accept: The paper presents a strong argument about an important issue that ought to be discussed and is of importance to a sub-area within the NeurIPS community.

Confidence: 4: You are confident in your assessment, but not absolutely certain. It is unlikely, but not impossible, that you did not understand some parts of the submission or that you are unfamiliar with some pieces of related work.

Thoroughness: 4: You read the paper and appendices and checked most of the details, including references..

Additional Comments To ACs And PCs:

This is a strong position paper that ties machine learning to a critical real-world problem. It's relevant, well-researched, and likely to inspire discussion in NeurIPS. Could be improved with clearer language and real-world examples, but it's a great fit for the track.

Additional Comments To PCs:

No major issues here. The paper's anonymous, follows NeurIPS guidelines, and makes a compelling case. It's a solid candidate for acceptance unless you're prioritizing papers with more experimental data.

Code Of Conduct Acknowledgement: Yes

 Revisions (/revisions?id=Sks4tFDrWA)

 BibTeX

 CC BY-NC-ND 4.0 (<https://creativecommons.org/licenses/by-nc-nd/4.0/>)

Keywords: ai, climate

TL;DR: This paper explores the dual role of AI as both a climate challenge and a potential climate solution

Abstract:

What is the net impact of artificial intelligence on climate change? Existing studies focus on AI's footprint, but few analyze AI's trade-offs. This paper develops a framework to quantify both the Greenhouse Gas (GHG) emissions and the climate change costs and benefits of AI systems, addressing the time value of carbon and the installed base of existing AI infrastructure. We examine the energy demands of AI, which are growing rapidly and threatening companies' net-zero commitments, while also analyzing AI's potential to enable emissions reductions through applications such as optimized energy systems, demand response, grid management, and electrification acceleration. This research introduces the Net Climate Impact Score (NCIS) of AI, a novel equation to calculate the net climate impact of AI technologies that considers both immediate emissions and potential future benefits, and provides a methodology for assessing AI projects holistically. We demonstrate that while current AI applications are predominantly emissions-intensive, strategic deployment focused on energy system transformation could potentially deliver net climate benefits within specific time frames and applications. However, improvements in energy efficiency and emissions reductions resulting from AI are, absent climate policy, likely to generate both direct and indirect rebound effects that could undermine the emissions reductions and reduce the climate benefits of AI. The research concludes with policy and industry recommendations that propose technological pathways that could maximize AI's positive impact while minimizing its environmental footprint.

Ethics: NO or VERY MINOR ethics concerns only**Position:** Yes, the paper argues for or against a position related to machine learning.**Summary:**

The paper argues that AI's climate impact must be assessed based on both its emissions and potential to reduce emissions, rather than focusing solely on its carbon footprint. The paper examines AI's climate impact by developing a framework that considers emissions and benefits. It introduces a Net Climate Impact Score equation to calculate impact. The authors show that AI applications create emissions, but strategic deployment could deliver benefits. They note that efficiency gains from AI create rebound effects that reduce benefits. The paper provides a framework for impact assessment that considers carbon time value and infrastructure, while offering recommendations to maximize benefits and minimize footprint.

Author Identification: No.**Support:** 4: excellent**Significance:** 4: excellent**Presentation:** 3: good**Context:** 4: excellent**Discussion:** 4: very likely**Alternative Position:** No**Strengths:**

- The position has been well argued with data. Even early quantitative framework such as the proposed net climate impact score can be a valuable starting point
- The paper considers important aspects like rebound effect and time value of carbon in analyzing the impact on carbon
- The data points provided throughout are well grounded in literature
- The paper acknowledges the limitations of speculative nature of future benefit estimates and uses range vs point estimates

Weaknesses:

- The paper does not consider any alternative position. For example, focus on carbon does not consider impact on water use, mining of critical minerals, or human exploitation during annotation.
- The proposed equations do not consider regional impacts on grids, pollution, or economy.
- As much of the numbers included are speculative, it would be good to see a validation method before they are used for real-world decisions. How can AI-enabled reductions be measured at scale?
- While the time value of carbon and rebound effect have been discussed, the proposed equations do not incorporate it for estimating net impact
- Opportunity cost of investing in AI vs other climate solutions is not considered
- It is unclear why stakeholders will adopt policies that are based on net climate impact for AI related decision making

Questions:

1. What are the alternative positions to the one you have considered, and how do they fare compared to your arguments? This is a critical aspect missing in the paper.
2. How would you propose measuring and validating AI enabled emissions reductions?
3. How would you incorporate time value of carbon and rebound effects into your equations?
4. How would you incentivize stakeholders to adopt the proposed framework? Why would people stop generating cat videos regardless of what the equation says?
5. More of a comment than question -- impact of inference far exceeds that of training.

Agreement: 5: strongly agree

Rating: 6: Weak Accept: The paper presents a solid argument about an issue of moderate importance to at least one sub-area of the NeurIPS community.

Confidence: 5: You are absolutely certain about your assessment. You are very familiar with the related work.

Thoroughness: 5: You read the paper and appendices rigorously and checked all of the details carefully, including references and proofs (if present).

Code Of Conduct Acknowledgement: Yes

Official Review of Submission598 by Reviewer 7Qe4

Official Review by Reviewer 7Qe4  30 Jul 2025, 13:58 (modified: 15 Aug 2025, 14:47)

 Program Chairs, Area Chairs, Reviewers Submitted, Reviewer 7Qe4, Authors

 Revisions (/revisions?id=Hu23wtZzwV)

Ethics: NO or VERY MINOR ethics concerns only

Position: Yes, the paper argues for or against a position related to machine learning.

Summary:

This paper argues that, instead of focusing on quantifying, reducing, and regulating the climate impact of AI, one must take a step further to also factor in the benefits from, for example, using AI tools to reduce carbon emissions of AI and other applications.

This work proposes to take a more holistic approach to consider the potential benefits of AI for climate mitigations and balance it with the carbon impact of AI. This is challenging because, first, the cost is incurred now while the reduction often comes later. Second, the scope is broad. Nonetheless, the paper describes three major factors to consider for the net carbon impact of AI: rebound effects, time value of carbon, energy and emission impact of AI.

While this work takes the first step describing what such framework can look like, there are many aspects that fall short. The model estimating the carbon cost of AI is preliminary and so is the methodology for potential benefits. It'd be great if the authors can continue the work to establish the described framework, refine and validate it with key use cases. The reviewer believes such a tool, by enabling what-if analysis, would be useful to many.

Author Identification: No.

Support: 2: fair

Significance: 2: fair

Presentation: 1: poor

Context: 2: fair

Discussion: 3: possibly

Alternative Position: No

Strengths:

The idea to make a framework assessing the net carbon impact of AI is commendable.

Weaknesses:

The framework for estimating the net carbon impact of AI needs significant improvement for it to be useful.

The paper is written with excessive direct quotes from other sources, such as news articles with eye-catching titles, hand-wavy projections. More scientific rigor is expected for a NeurIPS position paper.

Questions:

The idea to make a framework assessing the net carbon impact of AI is commendable. However, the scope is broad. Can you be more specific about the scope of carbon quantification across the "lifecycle" that will make it a useful tool? What are some key use cases you envision the tool enables? Can you please provide a few concrete examples?

Agreement: 4: agree

Rating: 4: Borderline reject: The paper presents a position, but the reasons to reject, e.g., unclear reasoning or limited support for the claims, outweigh reasons to accept.

Confidence: 4: You are confident in your assessment, but not absolutely certain. It is unlikely, but not impossible, that you did not understand some parts of the submission or that you are unfamiliar with some pieces of related work.

Thoroughness: 4: You read the paper and appendices and checked most of the details, including references..

Code Of Conduct Acknowledgement: Yes

📄 Revisions (/revisions?id=Tb9WaRbPIT)

Ethics: NO or VERY MINOR ethics concerns only

Position: Yes, the paper argues for or against a position related to machine learning.

Summary:

This paper develops a framework to quantify AI's net climate impact, balancing its greenhouse gas emissions against potential benefits like optimized energy systems. It introduces the Net Climate Impact Score (NCIS), a novel equation factoring in emissions, benefits, and the time value of carbon. The paper highlights AI's growing energy demands (1.5-4% of global emissions) but argues strategic applications (e.g., grid management, electrification) could reduce emissions by 1.5-10% by 2030. It warns of rebound effects undermining benefits without policy support. Contributions include the NCIS framework, a mixed-methods approach, and policy recommendations to minimize AI's footprint while maximizing its climate potential.

Author Identification: No.

Support: 4: excellent

Significance: 2: fair

Presentation: 3: good

Context: 3: good

Discussion: 4: very likely

Alternative Position: Yes, and alternative positions are well-considered and named but not addressed

Strengths:

The NCIS framework for estimating AI's climate impact while weighing costs and benefits is expertly developed in this paper. It has a solid foundation thanks to its mixed-methods approach (literature, surveys, interviews) and 47 references (IEA, World Bank). It identifies pressing problems, such as data center energy consumption, and makes practical policy suggestions. It adds depth and is extremely pertinent to NeurIPS and climate research because of its emphasis on rebound effects and the time value of carbon.

Weaknesses:

Empirical case studies of AI applications (such as particular grid optimizations) could enhance the paper. Accessibility is diminished by its technical terminology and small OCR mistakes (such as "edationion"). Giving non-AI solutions (like expanding renewable energy) precedence over AI-driven ones is an alternate viewpoint that hasn't been thoroughly investigated. It would be strengthened by additional discussion on how to apply NCIS in environments with limited resources.

Questions:

How feasible is NCIS adoption in developing countries with limited data?

Agreement: 4: agree

Rating: 7: Accept: The paper presents a solid argument about an important issue that remains unresolved and is of importance to at least one sub-area of the NeurIPS community.

Confidence: 4: You are confident in your assessment, but not absolutely certain. It is unlikely, but not impossible, that you did not understand some parts of the submission or that you are unfamiliar with some pieces of related work.

Thoroughness: 4: You read the paper and appendices and checked most of the details, including references..
