October 26, 2026

STATEMENT OF INTENT TO CONTINUE WORK IN THE UNITED STATES (8 C.F.R. § 204.5(h)(5)) AND PERSONAL STATEMENT OF VIVEK KUMAR MISHRA IN SUPPORT OF I-140 PETITION FOR ALIEN OF EXTRAORDINARY ABILITY (EB-1A)

Dear Immigration Officer,

I, Vivek Kumar Mishra, submit this statement pursuant to 8 C.F.R. § 204.5(h)(5) and in support of my Form I-140 petition for classification as an Alien of Extraordinary Ability (EB-1A) in the field of applied artificial intelligence, machine learning, and cloud systems engineering in critical financial and infrastructure systems. While my immediate proposed employment aligns with Part 6 of Form I-140 (SOC Code 15-1252: Software Developers) as a Senior Software Engineer designing AI-integrated backend systems for large-scale financial platforms, my overarching career endeavor in the United States is to **lead the architectural design, engineering strategy, and technical direction of AI-integrated enterprise cloud platforms** across critical financial and computing systems.

This statement serves two essential statutory and regulatory purposes: first, it provides clear evidence of my intent and concrete plans to continue working in my area of extraordinary ability in the United States, as required by 8 C.F.R. § 204.5(h)(5); and second, it summarizes the objective documentary evidence establishing my sustained national and international acclaim across six regulatory criteria under 8 C.F.R. § 204.5(h)(3).

My standing in this field is documented by independent metrics and expert validation: I have authored nine peer-reviewed scholarly articles, with two permanently indexed in the U.S. National Transportation Library (the official federal research repository) [Exhibits 68, 70] and actively cited in government-funded infrastructure research across multiple U.S. states and internationally [Exhibits 6, 7]; I was selected as a reviewer for the NeurIPS 2026 main conference [Exhibits 55–62]; I am an IEEE Senior Member, an honor held by approximately 8% of IEEE's 460,000+ members worldwide [Exhibit 77], and a Fellow of BCS, The Chartered Institute for IT (FBCS) [Exhibit 81]; for 55 consecutive months, from October 2021 through May 2026, I performed in a critical engineering role on the JPMorgan Chase platform serving more than 80 million cardmembers [Exhibits 85, 94]; and on August 11, 2026, I began working at The Vanguard Group through Randstad Digital [Exhibits 97, 98].

1. Original Contributions of Major Significance (8 C.F.R. § 204.5(h)(3)(v))

The significance of my scientific and technical contributions is demonstrated by independent peer adoption, federal archival, and institutional curriculum reliance.

I developed a Python-based machine-learning framework for infrastructure cost-benefit analysis, initially applied to highway-rail grade-separation prioritization [Exhibit 67]. Dr. Maxim A. Dulebenets, Associate Professor and Graduate Program Director at the FAMU-FSU College of Engineering, attests that he "explicitly cited this work in my own study" on rail crossing delays in Florida, and that my methodologies have "shaped aspects of our freight network modeling and equity-focused analyses in Florida" [Exhibit 6]. He further confirms that my models have been "used to inform similar lines of inquiry in multiple U.S. states (including Florida) and internationally (in countries like Italy and Iran)" [Exhibit 6]. Sinchan Banerjee, Director of Enterprise Data Architecture at UST, independently

corroborates that my research has been cited in government research projects in Florida, Italy, Iran, and Colombia [Exhibit 7].

In transit optimization, I engineered a TOPSIS-based multi-criteria optimization framework, supported by Senate Bill 1 and the U.S. Department of Transportation through the California State University Transportation Consortium, to prioritize California High-Speed Rail stations for transit-oriented development [Exhibit 68]. My research supervisor, Dr. Shailesh Chandra of California State University, Long Beach, confirms that my bi-objective and multi-objective optimization methods "led to innovative solutions that have been referenced by public agencies and in the academic literature" [Exhibit 8]. Two of my foundational research reports have been permanently indexed in the U.S. National Transportation Library: the high-speed rail financing report (ROSA P record dot/59030) [Exhibit 68] and the multimodal transportation access report (ROSA P record dot/61210) [Exhibit 70]. Dr. Zhenyu Wang, Senior Research Associate at the University of South Florida's Center for Urban Transportation Research, who has never worked with me personally, evaluated my portfolio and stated that my work "has garnered international recognition and already influenced government-funded programs in the U.S." and that my interdisciplinary expertise is "precisely the capability required for our national infrastructure modernization efforts" [Exhibit 9].

In October 2025, I authored *Design Patterns for AI Agents: A Structured Approach to Building Robust and Intelligent Systems* (ISBN 979-8268912371) as lead author [Exhibit 1]. The work establishes an engineering framework adapting classical software design patterns (Observer, Factory, Strategy, Broker, State Machine) to agentic AI systems. Demonstrating field-level educational adoption, Anand International College of Engineering formally added the book to its permanent Central Library collection [Exhibit 2], while Supaul College of Engineering, an AICTE-approved government institution under the Government of Bihar, formally adopted it as a recommended reference text for its Computer Science and Engineering curriculum [Exhibit 14], with additional institutional curriculum adoption confirmed by a second college [Exhibit 15]. Rahul Vishwakarma, a Fellow of the British Computer Society and holder of over 60 U.S. patents, states that he personally applied several of these design patterns to enhance his own engineering practice [Exhibit 13].

2. Authorship of Scholarly Articles (8 C.F.R. § 204.5(h)(3)(vi))

I have authored nine peer-reviewed scholarly articles on machine learning methodologies, artificial intelligence applications, and computational optimization frameworks [Exhibits 71, 73, 74]. In the applied sciences and critical infrastructure systems, the true significance of scholarly research is demonstrated by federal archival, policy relevance, and utilization in government-funded research initiatives. Two of my foundational research publications have been permanently archived in the U.S. National Transportation Library (ROSA P records dot/59030 and dot/61210) [Exhibits 68, 70] and actively cited by independent researchers to inform federally and state-funded infrastructure studies in Florida, as well as peer research across Italy, Iran, and Colombia [Exhibits 6, 7].

Several of these works are foundational research monographs on transportation optimization and financing published by the Mineta Transportation Institute, a U.S. Department of Transportation-funded national University Transportation Center. These include "Evaluating Financing Mechanisms and Economic Benefits to Fund Grade Separation Projects" [Exhibit 67], "Evaluating Innovative Financing Mechanisms for the California High-Speed Rail Project" [Exhibit 68], "Framework for Rail Transport Inequality Assessment" [Exhibit 66], and "Optimizing Multimodal Transportation Access"

[Exhibit 70]. My scholarly publications also include a peer-reviewed article in MDPI *Sustainability* [Exhibit 65], and my February 2026 paper in IJARSCT detailing AI-driven optimization of backend and cloud infrastructure in large-scale financial platforms [Exhibit 72].

3. Published Material About Me in Professional or Major Media (8 C.F.R. § 204.5(h)(3)(iii))

Major U.S. technical trade publications have quoted my expert insights on artificial intelligence and cloud systems: TechTarget [Exhibits 107, 108], Dice [Exhibit 109], and VKTR [Exhibit 110]. Full-length dedicated interviews covering my career and technical perspectives have been published by TechBullion [Exhibit 99] and VoyageLA [Exhibit 111]. The IEEE featured me as an IEEE Young Creator on IEEE Transmitter [Exhibit 100] and published an official speaker profile on IEEE.tv [Exhibit 101]. Furthermore, my knowledge dissemination efforts were covered in India's leading national daily newspapers, including Dainik Bhaskar and Rajasthan Patrika [Exhibits 103–105].

4. Participation as a Judge of the Work of Others (8 C.F.R. § 204.5(h)(3)(iv))

My technical expertise is routinely relied upon to evaluate the work of other researchers and professionals. I was selected as a peer reviewer for the NeurIPS 2026 main conference, completing formal reviews of four papers (Papers 1773, 5499, 19582, and 29968) [Exhibits 55–62]. In addition, I have evaluated scholarly work within the ecosystems of all three premier machine learning conferences: the NeurIPS 2025 Position Paper Track [Exhibits 20, 21, 42–47], the ICML 2026 AIWILD Workshop [Exhibits 48–54], and the ICLR 2025 FM-Wild Workshop [Exhibits 17–19]. In June 2025, I served on the IEEE Senior Member Application Virtual Review Panel, evaluating candidate dossiers to determine whether experienced professionals qualified for elevation to Senior Member status [Exhibits 31–33]. I have also served as a reviewer for international conferences (ACDSA 2026 [Exhibits 24, 25], ICECET 2026 [Exhibits 27–29]), scholarly journals (Informatica [Exhibits 36, 41], Virtus InterPress [Exhibits 34, 35]), and competitive hackathons including PennApps at the University of Pennsylvania [Exhibit 37], DragonHacks at Drexel University [Exhibit 38], and the 2024 Claro Awards in the Technology Category [Exhibit 39].

5. Membership in Associations Requiring Outstanding Achievement (8 C.F.R. § 204.5(h)(3)(ii))

I hold Senior Member grade in the Institute of Electrical and Electronics Engineers (IEEE), the highest rank for which members can apply, held by only approximately 8% of IEEE's 460,000+ members worldwide [Exhibits 75–77, 79]. Elevation to Senior Member requires a minimum of ten years of professional practice, five years of demonstrated significant performance, and peer reference endorsements from three current Senior Members or Fellows [Exhibits 76, 78]. I am also a Fellow of BCS, The Chartered Institute for IT (FBCS) [Exhibit 81], the highest grade of the United Kingdom's Royal Charter professional body for information technology, with over 70,000 members across 150+ countries [Exhibit 83]. BCS Fellowship requires documented evidence evaluated by an expert assessment panel across four criteria spanning technical body of work, professional impact, and standing in the community [Exhibit 82].

6. Leading or Critical Role for Organizations with a Distinguished Reputation (8 C.F.R. § 204.5(h)(3)(viii))

At JPMorgan Chase & Co. (America's largest bank, $4.1+ trillion in assets), I served from October 11,

2021, through May 2026 (55 consecutive months) in the position of Associate, Software Engineer II [Exhibits 94, 95], as a core backend engineer on the Chase Shopping Hub platform. The platform serves more than 80 million Chase cardmembers [Exhibit 85], processing 5,012,443 user requests and 22,623 orders in December 2025 with 99.9% reliability [Exhibit 87]. Corey Graham, Executive Director – Director of Software Engineering, attests that I "worked on building and deploying the core backend services that underpin the platform," "designed APIs that are now part of a mission-critical system," "played a hands-on role in stabilizing our backend systems," and regularly mentored team members [Exhibit 86]. Sumit Bhatnagar, Vice President, Engineering, independently confirms that I "took full ownership of the backend architecture," "operated with a level of autonomy typically reserved for senior technical leads," achieved approximately $100,000 in cloud cost savings, cut latency by 43% (53ms to 30ms), and launched the platform with zero downtime [Exhibit 93]. These contributions are further corroborated by peer and leadership commendations [Exhibits 88–90].

Previously, at Oracle, I served as a Member of Technical Staff for the Oracle Cloud Infrastructure (OCI) group, where I developed automation frameworks for OCI's core storage and compute modules, improving the reliability and scalability of the foundational cloud platform that supports thousands of global enterprise clients.

On August 11, 2026, I began working at The Vanguard Group (200 Vanguard Blvd, Malvern, PA) through Randstad Digital as an AWS Full Stack Developer [Exhibits 97, 98]. Randstad Digital confirms my responsibilities include improving resiliency engineering practices across platforms, developing automated incident response infrastructure, implementing OpenTelemetry integrations across browser, ECS, and Lambda environments (JavaScript, Java, Python, and AWS), contributing to architectural decisions, and mentoring junior engineering staff [Exhibit 97].

7. Statement of Detailed Plans to Continue Work in the Area of Expertise in the United States (8 C.F.R. § 204.5(h)(5))

Pursuant to 8 C.F.R. § 204.5(h)(5) and in direct alignment with Part 6 of Form I-140 (SOC Code 15-1252: Software Developers), I confirm my intent to continue working in the United States within my established area of extraordinary ability: applied artificial intelligence, machine learning, and cloud systems engineering in critical financial and infrastructure systems. Specifically, while executing my immediate role in designing AI-integrated backend systems for large-scale financial platforms, my broader professional endeavor encompasses **leading systems architecture, resiliency engineering, and technical strategy** for mission-critical cloud platforms across the U.S. financial sector. I have outlined my concrete plans as follows:

A. Prearranged Professional Engagement in Critical Financial Cloud Infrastructure: In direct furtherance of my endeavor in critical financial cloud platforms, I will continue my work at The Vanguard Group through Randstad Digital [Exhibits 97, 98]. In this role, my responsibilities center on improving resiliency engineering practices across platforms and applications, developing automation for incident response and infrastructure management, developing and supporting OpenTelemetry integrations across multiple application platforms and languages, contributing to architectural decisions and the implementation of solutions, and mentoring junior engineering staff [Exhibit 97].

B. Continuation of Applied Research in Intelligent Transportation and Infrastructure Systems: I will continue my independent applied research in computational modeling, machine learning, and multi-

criteria optimization for public infrastructure. Building upon my published TOPSIS frameworks and grade-separation safety models [Exhibits 67, 68, 70], I plan to collaborate with academic transportation centers, public transit agencies, and peer researchers—including those who have cited and built upon my work in Florida, California, and internationally—to develop AI-driven solutions that balance safety, operational efficiency, and transit equity. This endeavor directly aligns with United States national priorities established under the Infrastructure Investment and Jobs Act (IIJA).

C. Advancement and Dissemination of AI Agent Engineering Frameworks: Building on my technical book, *Design Patterns for AI Agents* (ISBN 979-8268912371) [Exhibit 1], I will continue researching, formulating, and publishing structured design patterns for production-grade agentic AI systems. As intelligent systems are increasingly integrated into high-stakes environments—such as financial market processing, healthcare workflows, and automated decision-making—my work addresses the vital national need for robust, explainable, and fault-tolerant AI architectures.

D. Continued Service to the U.S. Scientific and Engineering Community: I will continue to actively serve the U.S. research and professional community by fulfilling peer review assignments for premier AI conferences, including NeurIPS, ICLR, and ICML, continuing my panel service evaluating candidate credentials for the IEEE Senior Member Review Panel [Exhibits 31–33], and providing technical mentorship to early-career engineers and researchers through IEEE and BCS professional activities.

Conclusion

The documentary evidence demonstrates that I possess a sustained record of national and international acclaim dating from 2020 to the present, beginning with federally funded research at California State University, Long Beach [Exhibit 8], progressing through mission-critical engineering work at JPMorgan Chase and The Vanguard Group, and culminating in dual international credentialing (IEEE Senior Member, BCS Fellow) and selection to judge peers at NeurIPS, ICML, ICLR, and IEEE.

Furthermore, as disclosed in Part 9 of Form I-140, USCIS previously approved my immigrant petition under the EB-2 National Interest Waiver (Receipt: IOE0936432766, Texas Service Center), affirming the national importance of my endeavor; I respectfully request retention of my April 15, 2026 priority date pursuant to 8 C.F.R. § 204.5(e).

My clear evidence of prearranged professional commitments [Exhibits 97, 98] and detailed plans satisfy 8 C.F.R. § 204.5(h)(5) by establishing that I will continue applying my extraordinary ability in the United States by leading the design, resiliency, and architectural strategy of AI-integrated financial and cloud infrastructure, generating substantial national benefits. I respectfully request that my Form I-140 petition for classification as an Alien of Extraordinary Ability be approved.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed on October 26, 2026 at Claymont, DE.

Sincerely,

Vivek Kumar Mishra
